

Debugging

pdb implements an interactive debugging environment for Python programs. It includes features to let you pause your program, look at the values of variables, and watch program execution step-by-step, so you can understand what your program actually does and find bugs in the logic.

Starting the Debugger

From the Command Line

```
In [0]: def seq(n):  
        for i in range(n):  
            print(i)  
        return  
  
seq(5)  
  
0  
1  
2  
3  
4
```

From Within Your Program

```
In [0]: import pdb

#interactive debugging
def seq(n):
    for i in range(n):
        pdb.set_trace() # breakpoint
        print(i)
    return

seq(5)

# c : continue
# q: quit
# h: help
# list
# p: print
# p locals()
# p globals()
```

```
> <ipython-input-2-d5459efald5b>(7) seq()
-> print(i)
(Pdb) list
  2
  3     #interactive debugging
  4     def seq(n):
  5         for i in range(n):
  6             pdb.set_trace() # breakpoint
  7 ->         print(i)
  8         return
  9
 10     seq(5)
 11
 12
(Pdb) p i
0
(Pdb) p n
5
(Pdb) p locals()
{'i': 0, 'n': 5}
(Pdb) c
0
> <ipython-input-2-d5459efald5b>(6) seq()
-> pdb.set_trace() # breakpoint
(Pdb) list
  1     import pdb
  2
  3     #interactive debugging
  4     def seq(n):
  5         for i in range(n):
  6 ->         pdb.set_trace() # breakpoint
  7             print(i)
  8         return
  9
 10     seq(5)
 11
(Pdb) p locals()
{'i': 1, 'n': 5}
(Pdb) c
1
> <ipython-input-2-d5459efald5b>(7) seq()
-> print(i)
(Pdb) p locals()
{'i': 2, 'n': 5}
(Pdb) c
2
> <ipython-input-2-d5459efald5b>(6) seq()
-> pdb.set_trace() # breakpoint
(Pdb) p locals()
{'i': 3, 'n': 5}
(Pdb) h
```

Documented commands (type help <topic>):

=====

EOF	c	d	h	list	q	rv	undisplay
a	cl	debug	help	ll	quit	s	unt
alias	clear	disable	ignore	longlist	r	source	until
args	commands	display	interact	n	restart	step	up
b	condition	down	j	next	return	tbreak	w
break	cont	enable	jump	p	retval	u	whatis
bt	continue	exit	l	pp	run	unalias	where

Miscellaneous help topics:

BdbQuit:

```

Debugger Commands

1. h(elp) [command]

Without argument, print the list of available commands. With a command as argument, print help about that command. help pdb displays the full documentation (the docstring of the pdb module). Since the command argument must be an identifier, help exec must be entered to get help on the ! command.

2. w(here)

Print a stack trace, with the most recent frame at the bottom. An arrow indicates the current frame, which determines the context of most commands.

3. d(own) [count]

Move the current frame count (default one) levels down in the stack trace (to a newer frame).

4.c(ontinue))

Continue execution, only stop when a breakpoint is encountered.

5. q(uit)

Quit from the debugger. The program being executed is aborted.

Terminal/Command prompt based debugging
